Quarto enables you to weave together content and executable code into a finished document. To learn more about Quarto see https://quarto.org/.

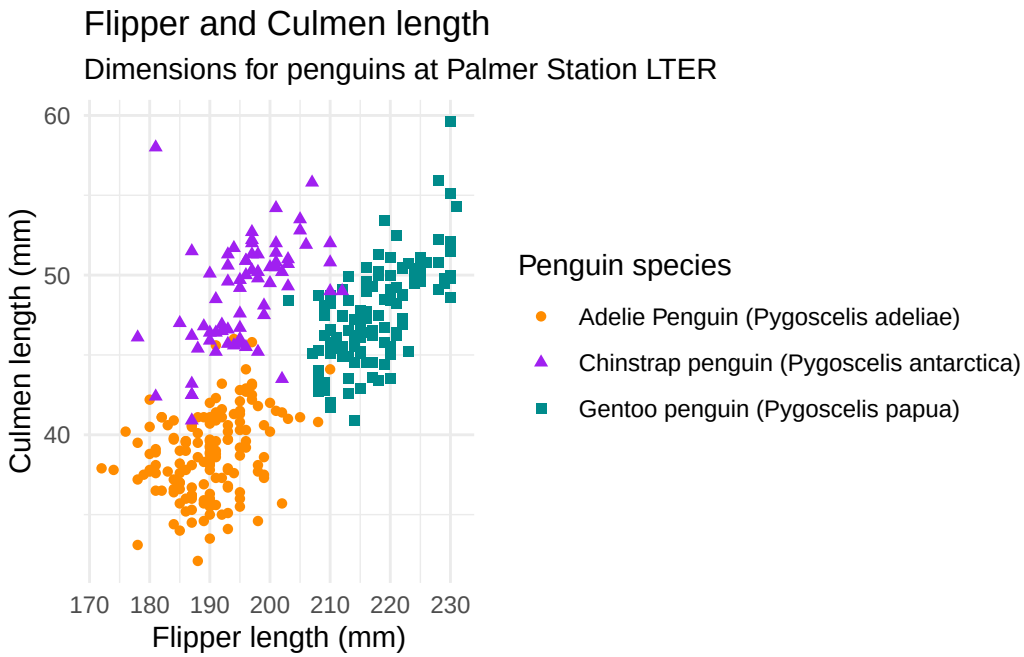

Meet the penguins

The `penguins` data from the palmerpenguins package contains size measurements for344 penguins from three species observed on three islands in the Palmer Archipelago, Antarctica. More about this package can be found in this paper written by Horst et al. (2022). Apparently, the penguins dataset was created in efforts to create a more realisitc dataset that can be used for practice. The usual iris dataset, one of the best-known and widely used data sets, is seen as quite unrealistic in terms of its setup and the origins are a bit of a mystery (Unwin and Kleinman 2021).

Results

I made adjustment to the chunk to not show the code that is being used to generate the plot as well as not displaying the warning messages that arises.

Inline code

There are 3 species of penguins in this dataset. Per species there are 124 Gentoo penguins, 68 Chinstrap penguins and lastly 152 Adelie penguins. In total, there are 344 penguins in the dataset.

Sourcing Scripts

```
do_addition <- function(number1, number2){

        # Check that arguments provided are numberic
        if(class(number1) != "numeric" | class(number2) != "numeric"){
                print("Error: one or more of your inputs are not numeric")

        # Perform simple addition and return the result
        } else{
                result <- number1 + number2
                return(result)
        }
}
```

```r
# first test
do_addition(3, 4)
```

```
[1] 7
```

```r
# second test
do_addition(837, 283)
```

```
[1] 1120
```
